

Business and Direction

iView Systems had an outstanding year in 2008 ! New and innovative strategic partnerships have been formed and product integration completed with the likes of TYCO, Cisco, Genetec and Guard Tour Systems. Our client list kept growing with fortune 1000 companies and major gaming facilities including additions and new installations in Macau, Australia and New Zealand.

Our mission is to become the leading provider of innovative risk management software solutions in gaming and corporate security environments. 2009 should provide a break-through year in growth, solidifying our position as a key supplier of risk management solutions.

New to the iView Suite of Products:

The latest and greatest products in addition to our iTrak V5 release, included iDVR Acquire (Intelligent Digital Video Recorder Acquisition) and iLPR (Intelligent Licence Plate Recognition).

Currently risk managers, security officers and surveillance staff must review and pull evidence video and images from separate Digital Video/Network Video Recorder (DVR/NVR) systems. These videos and images must be accessed using the DVR/NVR client software and then exported typically to a separate network or drive. Once exported, the relevant staff then must log into the reporting system and attach this information.

The iDVR Acquire module plugs directly into the iTrak media interface allowing media capture via 3rd party Digital Video Management Systems for daily logs, incident reports, subjects and more. This modular architecture enables clients to effectively

customize the system to meet their specific needs.

License Plate Recognition (LPR) technology is one of the most reliable and mature video analytic technologies available today. Our integration of Genetec's AutoVu Sharp LPR hardware into the iTrak Incident Reporting & Risk Management Platform provides additional benefits for automated alerting and reporting.

The iLPR – Intelligent License Plate Recognition module automatically alerts selected iTrak users when a self excluded gaming patron or an unwanted vehicle enters or exits the property. This system leads to increased and effective self-exclusion programs and trespass management.

From undesirable and self excluded patron identification, iLPR and AutoVu Sharp cameras combined with the iTrak System can improve self exclusion programs along with the safety and security of any risk managed environment. This proactive technology is being integrated into casino's incident reporting and risk management software globally.

Profile:

iView Systems is focused on the delivery of integrated security and surveillance software platforms, including Incident Reporting, Visitor Management, License Plate Recognition, Intelligent Digital Video Acquisition and Dispatch Security Systems. These products assist in reducing associated losses by the rapid identification of individuals involved in loss, threat creation and other specific activities. iView provides unique software, platforms and services to the global security marketplace, including the gaming, corporate, banking, transit and other loss prevention environments.
